

"Get paid for the power you already send back."

What GridPay Is

GridPay reads the utility's own 15 minute meter data, pays homeowners for the solar and battery energy they export, and shifts battery dispatch into the windows where the grid pays the most. We sell no hardware and install nothing. The equipment is already on the roof and on the wall. It just needed somebody to go read the meter.

Proof You Can Say Out Loud

91 meters enrolled on Smart Meter Texas · 47 exporting in the last 30 days · 74.7 megawatt hours verified against the utility · 1,871 settlements on a public ledger. Every number a homeowner earns can be audited against the utility's own record. Nobody else in this market lets them do that.

Why Now

- The federal residential battery tax credit ended December 31, 2025. The subsidy era for buying batteries is over. The performance era for the batteries already on walls is what is left.
- Roughly 98 percent of Texas home batteries participate in no virtual power plant. They sit idle through every peak event.
- Around 100 US solar companies have gone bankrupt since 2023. Their customers are orphaned: dead warranties, no support, systems quietly misconfigured. Those homeowners are your lists.

The Money Math

A Texas homeowner buys power at 16 to 20 cents and sells their exports back at 3 to 5 cents. Every exported kilowatt hour leaks 11 to 16 cents of value.

annual battery recovery = exported kWh × (day rate – buyback rate)

If that number does not beat the financed cost of the battery, we tell the homeowner so and walk. Honesty is the brand. It is also why referrals close.

The Assessment: Four Numbers

#	Number	What it tells you
1	Percent of usage inside the free window	Below 40 percent on a free nights plan means the plan is fighting their solar.
2	Total kilowatt hours exported	The size of the leak.
3	Export at buyback vs export at day rate	The battery math. This is where the sale lives.
4	Consumption during paid hours	What a battery or a plan switch can actually offset.

Never assert a diagnosis before the data is in. The interval data says which fix is right: plan switch, battery, or load shift.

The Ownership Gate

Status	Play
--------	------

OWNED (cash or loan)	Full play. Monitor, reconfigure, enroll, earn. This is the beachhead.
LEASED / PPA	Monitor and advocate only. The financier owns the battery and the contract is enforceable. Changing settings can breach the lease and void the warranty. Never touch the config.

Territory Notes

Market	How to sell it
Houston (Yousuf)	Live meter reads through Smart Meter Texas are the wow moment: pull their real export data on the call. 308 lead homes, 274 already received our letter, so open with that. Battery pitch runs on the money math above.
Illinois (Noah)	No live meter reads here (Smart Meter Texas is Texas only), so sell the bill review. 750 exclusive orphan homes where the installer went bankrupt: that is the door opener nobody else can use. Battery sells on backup plus bill math, with ComEd's virtual power plant program as the future upside. Do not pitch a state rebate on existing batteries. It does not exist.

Never Say These

- Never call GridPay a **licensed retail electric provider**. A partner holds the license.
- Never promise a specific dollar earning before the meter data is in.
- Never assert the homeowner bought something from us or from you before. "We work with solar homeowners in your area" survives a dirty list. A false claim does not.
- Never quote a customer's provider or plan from a single source. Verify or ask.
- Never guarantee grid program payouts, and never promise a live meter read outside Texas.

Objections, Fast

They say	You say
"Sounds like a scam."	Every payment settles against the utility's own meter record and posts to a public ledger. You can audit the number that pays you. Ask any other company in this space to show you that.
"My installer disappeared."	That is exactly who we built this for. The hardware still works. It just has nobody watching it. We become the watcher and it starts earning.
"I have free nights."	Free nights plans raise the daytime rate to pay for the free window. Your solar produces in the day. The two salespeople who sold you those both gave you good advice that cancels out. Let us pull the numbers and see what it is really costing.
"I do not have a battery."	Then you are exporting at 3 to 5 cents and buying back at 16 to 20. No battery is the worst case for that leak. The assessment shows exactly what a battery would recover, and if it does not pencil, we will tell you.
